## CHEMICAL KINETICS

Einstein Casses Unit No. 102, 103, Vardhman Ring Road Plaza, Vikas Puri Extn., Outer Ring Road New Delhi-110 018, Ph. : 9312629035,8527112111

C1A Chemical Kinetics is that branch of physical chemistry which deals with the study of the speed of a chemical reaction. Such studiesd also enable us to understand the mechanism by which the reaction occurs.
C1B Rate of reaction :
The rate of reaction is defined as the amount of change in concentration divided by the corresponding time interval or rate is the concentration change per unit time.

Rate of reaction $=\frac{\text { Changeinconc. }}{\text { time }}=\frac{\mathbf{d x}}{\mathbf{d t}}$
For the reaction $\mathrm{aA}+\mathrm{bB} \rightarrow \mathrm{cC}+\mathrm{dD}$
Instantaneous rate $=-\frac{1}{a} \frac{d[A]}{d t}=-\frac{1}{b} \frac{d[B]}{d t}=\frac{1}{c} \frac{d[C]}{d t}=\frac{1}{d} \frac{d[D]}{d t}$

Average rate

$$
=-\frac{1}{a} \frac{\Delta[\mathrm{~A}]}{\Delta t}=-\frac{1}{\mathrm{~b}} \frac{\Delta[\mathrm{~A}]}{\Delta \mathrm{t}}=\frac{1}{\mathrm{c}} \frac{\Delta[\mathrm{C}]}{\Delta \mathrm{t}}=\frac{1}{\mathrm{~d}} \frac{\Delta[\mathrm{D}]}{\Delta \mathrm{t}}
$$

-ve sign. indicates decrease of conc. of reactants with time $t$.
Rate of disappearance of $\mathrm{A}=-\frac{\mathbf{d}[\mathbf{A}]}{\mathbf{d t}}$, Rate of formation of $\mathrm{C}=\frac{\mathbf{d}[\mathbf{C}]}{\mathbf{d t}}$

* Rate of reaction and rate of formation or rate of disappearance expression can be same if stoichiometric coefficient is one.

## Practice Problems :

1. In the reaction $A+2 B \rightarrow 3 C+D$ which of the following expressions does not correctly describe changes in the concentration of various species as a function of time?
(a) $\frac{\mathrm{d}[\mathrm{C}]}{\mathrm{dt}}=\frac{-3 \mathrm{~d}[\mathrm{~A}]}{\mathrm{dt}}$
(b) $\frac{3 \mathrm{~d}[\mathrm{D}]}{\mathrm{dt}}=\frac{\mathrm{d}[\mathrm{C}]}{\mathrm{dt}}$
(c) $\frac{3 \mathrm{~d}[\mathrm{~B}]}{\mathrm{dt}}=\frac{-2 \mathrm{~d}[\mathrm{C}]}{\mathrm{dt}}$
(d) $\frac{2 \mathrm{~d}[\mathrm{~B}]}{\mathrm{dt}}=\frac{\mathrm{d}[\mathrm{A}]}{\mathrm{dt}}$
2. Rate of formation of $\mathrm{SO}_{3}$ in the following reaction $2 \mathrm{SO}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{SO}_{3}$ is $100 \mathrm{~kg} \mathrm{~min}^{-1}$. Hence rate of disappearance of $\mathrm{SO}_{2}$ will be :
(a)
$100 \mathrm{~kg} \mathrm{~min}^{-1}$
(b) $80 \mathrm{~kg} \mathrm{~min}^{-1}$
(c) $64 \mathrm{~kg} \mathrm{~min}^{-1}$
(d) $32 \mathrm{~kg} \mathrm{~min}^{-1}$
[Answers : (1) d (2) b]

## C2A Rate law, molecularity and order of reaction

According to the rate law the "rate of reaction is directly proportional to the concentration of reactant and reactants are raise to some power which may or may not be equal to stoichiometry coefficient".
For a reaction :

$$
\mathrm{aA}+\mathrm{bB} \rightarrow \text { product }
$$

rate $=\mathrm{k}[\mathrm{A}]^{\mathrm{m}}[\mathrm{B}]^{\mathrm{n}} \quad \ldots . . \quad[\mathrm{A}],[B]$ are the molar concentrations or active masses.
$\mathrm{k}=$ rate contt, specific rate contt. or velocity contt.
Order of reaction w.r.t. $A=m, B=n$. Overall order of reaction $=m+n$
molecularity $=\mathrm{a}+\mathrm{b}$
molecularity alway a whole number (> O)

## C2B Difference between order and molecularity :

## Molecularity

1. In elementary reactions, it is the total number 1. of atoms or molecules taking part in the balanced equation, whereas for the complex reactions it has no significance.
2. It is the theoretical concept based on the number of molecules of an elementary equation
3. It will not change with the change in conditions i.e. temperature, pressure etc.
4. It is always an integer i.e. never be zero
5. For elementary reactions the order and molecularity may be same or different.

* for Pseudo molecular reaction - order and molecularity are different
* units of rate : $\mathrm{mol} \mathrm{L}^{-1}$ time $^{-1}$

C3A Rate constant :
units of k - for reaction of $\mathrm{n}^{\text {th }}$ order

$$
k=\frac{1}{\text { time }} \times \frac{1}{[\text { Conc. }]^{\mathrm{n}-1}}
$$

C3B Integrated equation for rate constant of different order reactions:
A $\rightarrow$ Products
Let $\mathrm{A}_{0}=$ initial concentration of reactant.
$A_{0}-x=$ remaining conc. of reactant at time ' $t$ ', $x=$ concentration of reactant decomposed at time ' $t$ '
$\mathrm{T}_{50}=$ half-life period which is the time required by the reaction to undergo $50 \%$ conversion into the

$$
\text { products. i.e., at } \mathrm{t}=\mathrm{T}_{50}, \mathrm{x}=\frac{\left[\mathbf{A}_{\mathbf{0}}\right]}{\mathbf{2}} \text {. }
$$

## C3C Zero order reaction :

$$
\text { A } \rightarrow \text { Product }
$$

at $\mathbf{t}=\mathbf{0}$
at time $t$
$\mathbf{A}_{0}-\mathbf{x}$
Rate expression of a zero order reaction as shown as $r=k$
for zero order : $\mathbf{k}=\frac{\mathbf{x}}{\mathbf{t}}, \mathrm{k}$ has a unit mol $\mathrm{lt}^{-1} \mathrm{time}^{-1}$
for e.g. photochemical reaction like $\left(\mathrm{H}_{2}+\mathrm{Cl}_{2} \rightarrow 2 \mathrm{HCl}\right)$ is a zero order reaction.
At $\mathrm{t}=\mathrm{T}_{50}, \mathrm{x}=\frac{\mathbf{A}_{\mathbf{0}}}{\mathbf{2}}, \mathrm{T}_{50}=\frac{\left[\mathbf{A}_{\mathbf{0}}\right]}{\mathbf{2 k}}$
C3D First order reaction :

$$
\text { A } \rightarrow \text { product }
$$

at time $\mathrm{t}=0 \quad \mathrm{~A}_{0} \quad 0$
at time $t \quad \mathrm{~A}_{0}-\mathrm{x} \quad \mathrm{x}$
Rate law expression for the first order reaction is

$$
\mathrm{r}=\mathrm{k}[\mathrm{~A}]
$$

for first order :
$\mathbf{A}_{\mathbf{t}}=\mathbf{A}_{\mathbf{0}} \mathbf{e}^{-\mathbf{k t}}, \mathbf{k}=\frac{\mathbf{2 . 3 0 3}}{\mathbf{t}} \log \frac{\mathbf{A}_{\mathbf{0}}}{\left(\mathbf{A}_{\mathbf{0}}-\mathbf{x}\right)}$, At $\mathrm{t}=\mathrm{T}_{50} \mathbf{k}=\frac{\mathbf{0 . 6 9 3}}{\mathbf{T}_{\mathbf{5 0}}}, \quad \mathrm{T}_{75 \%}=2 \mathrm{~T}_{50 \%}, \mathrm{~T}_{999.9 \%} \approx 10 \mathrm{~T}_{50 \%}$

* Amount after n half lives for Ist order

$$
[\mathrm{A}]_{\mathrm{t}}=[\mathrm{A}]_{0}(1 / 2)^{\mathrm{n}}
$$

Graph of first order reaction :

## Practice Problems :

1. Ethylene is produced by $\underset{\text { Cyclobu tane }}{\mathrm{C}_{4} \mathrm{H}_{8} \xrightarrow{\Delta}} 2 \mathrm{C}_{2} \mathrm{H}_{4}$. The rate constant is $\mathbf{2 . 4 8} \times \mathbf{1 0}^{-4} \mathbf{s e c}^{-1}$. In what time will the molar ratio of the ethylene to cyclobutane in reaction mixture attain the value 1
(a)
27.25 minute
(b)
28.25 minute
(c) 25 minute
(d) $\quad 20$ minute
2. Mathematical expression for $t_{1 / 4}$ i.e. when $(1 / 4)^{\text {th }}$ reaction is over following first order kinetics can be given by
(a) $\quad \mathrm{t}_{1 / 4}=\frac{2.303}{\mathrm{~K}} \log 4$
(b) $\quad \mathrm{t}_{1 / 4}=\frac{2.303}{\mathrm{~K}} \log 2$
(c) $\quad \mathrm{t}_{1 / 4}=\frac{2.303}{\mathrm{~K}} \log \frac{4}{3}$
(d) $\mathrm{t}_{1 / 4}=\frac{2.303}{\mathrm{~K}} \log \frac{3}{4}$
3. The rate constant of a first order reaction is $4 \times 10^{-3} \mathrm{sec}^{-1}$. At a reactant concentration of 0.02 M , the rate of reaction would be
(a) $8 \times 10^{-5} \mathrm{M} \mathrm{sec}^{-1}$
(b) $4 \times 10^{-3} \mathrm{M} \mathrm{sec}^{-1}$
(c) $\quad 2 \times 10^{-1} \mathrm{M} \mathrm{sec}^{-1}$
(d) $4 \times 10^{-1} \mathrm{M} \mathrm{sec}^{-1}$
4. In a first order reaction, the concentration of the reactant is decreased from 1.0 M to 0.25 M in 20 minute. The rate constant of the reaction would be
(a)
$10 \mathrm{~min}^{-1}$
(b)
$6.931 \mathrm{~min}^{-1}$
(c) 0.6931 min $^{-1}$
(d) 0.06931 min $^{-1}$
[Answers: (1) a (2) c (3) a (4) d]

C3E Second order reaction :

$$
\text { A } \rightarrow \text { product }
$$

at time $\mathrm{t}=0$

$$
\mathrm{A}_{0} \quad 0
$$

at time t
$\mathrm{A}_{0}-\mathrm{x} \quad \mathrm{x}$
Rate law expression for the second order reaction is

$$
\mathrm{r}=\mathrm{k}[\mathrm{~A}]^{2}
$$

$\mathbf{k}=\frac{1}{\mathbf{t}}\left[\frac{\mathbf{1}}{\mathbf{A}_{\mathbf{t}}}-\frac{\mathbf{1}}{\mathbf{A}_{\mathbf{0}}}\right], \quad \mathbf{T}_{50}=\frac{\mathbf{1}}{\mathbf{A}_{\mathbf{0}}} \cdot \frac{\mathbf{1}}{\mathbf{k}}, \quad$ for nth order : $\mathbf{t}_{1 / 2} \alpha \frac{\mathbf{1}}{[\mathbf{A}]_{0}^{\mathrm{n}-1}}$

## Practice Problems :

1. Following is the graph between $(a-x)^{-1}$ and time $t$ for second order reaction $\theta=\tan ^{-1}(0.5) O A=2 \mathrm{~L} \mathrm{~mol}^{-1}$.

hence rate at the start of the reaction is :
(a)
$1.25 \mathrm{~L} \mathrm{~mol}^{-1} \mathrm{~min}^{-1}$
(b) $\quad 0.5 \mathrm{~L} \mathrm{~mol}^{-1} \mathrm{~min}^{-1}$
(c)
$0.125 \mathrm{~L} \mathrm{~mol}^{-1} \mathrm{~min}^{-1}$
(d) $\quad 1.25 \mathrm{~L} \mathrm{~mol}^{-1} \mathrm{~min}^{-1}$
[Answers: (1) c]

C4A Experimental determination of rate constant of different first order reaction
(i) decomposition of hydrogen peroxide

$$
\mathrm{H}_{2} \mathrm{O}_{2} \longrightarrow \mathrm{H}_{2} \mathrm{O}+\frac{1}{2} \mathrm{O}_{2}
$$

hence $\quad \mathrm{V}_{0}=$ volume of $\mathrm{KMnO}_{4}$ at start $\propto \mathrm{A}_{0}$
$\mathrm{V}_{\mathrm{t}}=$ volume of $\mathrm{KMnO}_{4}$ at time $\mathrm{t} \propto\left(\mathrm{A}_{0}-\mathrm{x}\right)$
hence for the first order reaction : $\mathbf{k}=\frac{\mathbf{2 . 3 0 3}}{t} \log \frac{V_{0}}{V_{t}}$
(ii) Acid hydrolysis of Ethyl Acetate:

excess
$\mathrm{V}_{0}=$ volume of NaOH at start $\propto$ catalyst $\left[\mathrm{H}^{+}\right], \mathrm{V}_{\mathrm{t}}=$ volume of NaOH at time $\propto \mathrm{x}+\left[\mathrm{H}^{+}\right]$
$\mathrm{V}_{\infty}=$ volume of NaOH at infinite time $\propto\left[\mathrm{A}_{0}\right]+\left[\mathrm{H}^{+}\right]$
Hence for Pseudo first order reaction: $k=\frac{\mathbf{2 . 3 0 3}}{t} \log \frac{V_{\infty}-V_{0}}{V_{\infty}-V_{t}}$
(iii) Pressure change method :

This is to be used in gaseous phase reaction. As reaction proceeds there may be a change in total pressure. By measuring initial and total pressure at the start and after time $t$, value of $\mathrm{A}_{0}$ and ( $\mathrm{A}_{0}-\mathrm{x}$ ) can be determined in terms of pressures.

|  | $\mathrm{A}(\mathrm{g}) \longrightarrow \mathrm{y} \mathrm{B}(\mathrm{g}$ |
| :---: | :---: |
| at $\mathrm{t}=0$ | $\mathrm{P}_{0} \quad 0$ |
| at time t | $\left(\mathrm{P}_{0}-\mathrm{P}\right) \quad \mathrm{yP}$ |
| Total pressure at time 't' | $\mathrm{P}_{\mathrm{t}}=\mathrm{P}_{\mathrm{A}}+\mathrm{P}_{\mathrm{B}}$ |
|  | $P_{t}=P_{0}-P+y P$ |
| Therefore, | $\mathrm{P}_{0}-\mathrm{P} \propto\left(\mathrm{A}_{0}-\mathrm{x}\right)$ |

$$
\begin{aligned}
& \mathrm{P}_{0} \propto \mathrm{~A}_{0} \\
& \mathrm{k}=\frac{2.303}{\mathbf{t}} \log \frac{\mathbf{P}^{0}}{\mathbf{P}^{0}-\mathbf{P}}
\end{aligned}
$$

## Practice Problems :

1. For the first order reaction $A(g) \rightarrow 2 B(g)+C(g)$, the initial pressure $P_{A}=90 \mathrm{~mm} \mathrm{Hg}$, the pressure after 10 minutes is found to be 180 mm Hg . The rate constant of the reaction is
(a)
$1.15 \times 10^{-3} \mathrm{sec}^{-1}$
(b) $\quad 2.3 \times 10^{-3} \mathrm{sec}^{-1}$
(c) $\quad 3.45 \times 10^{-3} \mathrm{sec}^{-1}$
(d) $\quad 4.6 \times 10^{-3} \mathrm{sec}^{-1}$
2. The reaction $A(g)+2 B(g) \rightarrow C(g)+D(g)$. Initial pressure of $A$ and $B$ are respectively $p_{A}=0.60 \mathrm{~atm}, p_{B}=$ 0.80 atm . When $p_{C}=0.20 \mathrm{~atm}$, the rate of the reaction, relative to the initial rate, is :
(a) $\frac{1}{48}$
(b) $\frac{1}{24}$
(c) $\frac{1}{6}$
(d) $\frac{1}{4}$
3. At $100^{\circ} \mathrm{C}$, a gaseous reaction $\mathrm{A} \rightarrow \mathrm{B}+2 \mathrm{C}$; is observed to be of first order. On starting with pure $A$, at the end of 14 minutes, the total pressure was found to be 264 mm of Hg . After a long time the total pressure of the system was 450 mm of $\mathbf{~ H g}$. Thus the Initial pressure of $A$ is
(a)
57
(b) 150
(c) 114
(d) 190
[Answers: (1) a (2) c (3) b]

C4B Different methods for determining the order of reaction :
(i) Rate law method
(ii) Half life method
(iii) Integrated rate equation method

Practice Problems :

1. For the reaction, $2 \mathrm{~A}+2 \mathrm{~B} \rightarrow$ Products the following initial rates were obtained at various given initial concentrations
S.No. [A] [B] Rate $\left(\mathrm{mol} \mathrm{L}^{-1} \sec ^{-1}\right)$
$\begin{array}{llll}1 . & 0.1 & 0.2 & 0.46\end{array}$
$\begin{array}{llll}2 . & 0.2 & 0.2 & 1.84\end{array}$
$\begin{array}{llll}3 . & 0.2 & 0.1 & 0.92\end{array}$
The specific rate constant for the reaction is
(a)
$2.3 \mathrm{sec}^{-1}$
(b) $\quad 0.46 \mathrm{~L} \mathrm{~mol}^{-1} \mathrm{sec}^{-1}$
(c) $\quad 2.3 \times 10^{2} \mathrm{~L}^{2} \mathrm{~mol}^{-1} \mathrm{sec}^{-1}$
(d) $\quad \mathbf{1 . 1 2 5} \times \mathbf{1 0}^{2} \mathrm{~L}^{2} \mathrm{~mol}^{-2} \mathrm{sec}^{-1}$
2. The following data pertains to a reaction between $A$ and $B$
S.No.
[A] mol/lit.
[B] mol/lit.
Rate ( $\mathrm{mol} /$ lit) time ${ }^{-1}$
3. 

$1 \times 10^{-2}$
$2 \times 10^{-2}$
$2 \times 10^{-2}$
$2 \times 10^{-4}$
2.
$2 \times 10^{-2}$
$2 \times 10^{-2}$
$4 \times 10^{-4}$
3.

Which of the following influence(s) can be drawn from the above data?

1. Rate constant of the reaction is $10^{-4}$
2. Rate law of the reaction is $K[A][B]$
3. Rate of reaction increases four times on doubling the concentration of both the reactants. Select the correct answer using the codes given below
(a)
1, 2 and 3
(b) 1 and 2
(c) 2 and 3
(d) 3 alone
4. From the following data, the activation energy for the reaction (cal/mol) $\mathbf{H}_{2}+\mathrm{I}_{2} \rightarrow \mathbf{2 H I}$

| $\mathrm{T}, \mathrm{K}$ | $1 / \mathrm{T}, \mathrm{K}^{-1}$ | $\log _{10} \mathrm{~K}$ |
| :--- | :--- | :--- |
| 769 | $1.3 \times 10^{-3}$ | 2.9 |
| 667 | $1.5 \times 10^{-3}$ | 1.1 |

(a) $4 \times 10^{4}$
(b)
$2 \times 10^{4}$
(c) $8 \times 10^{4}$
(d) $3 \times 10^{4}$
[Answers : (1) d (2) c (3) a]

## C5A Effect of temperature on reaction rate :

The rate of chemical reaction generally increases on increasing the temperature.

* Temperature coefficient of a reaction is defined as the ratio of rate constant at two temperatures differing by 10 K (generally $25^{\circ}$ and $35^{\circ} \mathrm{C}$ ). Observed value usually lies between 2 and 3 for most of the reactions.
* Larger the value of $\mathrm{E}_{\mathrm{a}}$, smaller the value of rate constant.
* Larger the value of $\mathrm{E}_{\mathrm{a}}$, greater is the effect of a given temperature on k .
* At lower temperature, increase in temperature causes more change in the value of $k$ than that at higher temperature.
C5B Arrhenius equation :
Variation of rate constant k with temperature $\mathrm{T}(\mathrm{K})$ is given by Arrhenius equation.
$\mathrm{k}=\mathrm{Ae}^{-\mathrm{E} / \mathrm{RT},}, \quad \ln \mathrm{k}=\ln \mathrm{A}-\frac{\mathrm{E}_{\mathrm{a}}}{\mathrm{RT}}, \quad \log \mathrm{k}=\log \mathrm{A}-\frac{\mathrm{E}_{\mathrm{a}}}{2.303 R T}$
Where A is called the frequency factor or the pre-exponential factor. Collectively A and $\mathrm{E}_{\mathrm{a}}$ are called the Arrhenius parameters of the reaction.
when $\mathrm{T} \rightarrow \infty$, then $\mathrm{k}=\mathrm{A}$
C5C Graph on rate constant :

* $\quad \log \frac{\mathbf{k}_{\mathbf{2}}}{\mathbf{k}_{\mathbf{1}}}=\frac{\mathbf{E}_{\mathbf{A}}}{\mathbf{2 . 3 0 3 R}}\left[\frac{\mathbf{1}}{\mathbf{T}_{1}}-\frac{\mathbf{1}}{\mathbf{T}_{\mathbf{2}}}\right]$, where $\mathrm{k}_{1}$ and $\mathrm{k}_{2}$ are rate constants at temperature $\mathrm{T}_{1}$ and $\mathrm{T}_{2}$ respectively.
* Temperature coefficient $=\frac{\text { Rate constant }(\mathbf{T}+\mathbf{1 0})^{\mathbf{0}} \mathbf{C}}{\text { rate constant at } \mathbf{T}^{\mathbf{0}} \mathbf{C}}$

## CK - 8

## Practice Problems:

1. For a gaseous reaction the plot of $\log k$ against $1 / T$ gave a straight line with a slope of $\mathbf{- 8} \times 10^{\mathbf{3}}$. The activation energy $E$ for the reaction is
(a) $\frac{8 \times 10^{3} \times 2.303}{\mathrm{R}}$
(b) $\frac{8 \times 10^{3} \times \mathrm{R}}{2.303}$
(c) $8 \times 10^{3} \times 2.303 \mathrm{R}$
(d) $\frac{8 \times 10^{3}}{\mathrm{R} \times 2.303}$
2. The rate of reaction is doubled for evergy $10^{\circ}$ rise in temperature. The increase in reaction rate as a result of temperature rise from $10^{\circ}$ to $100^{\circ}$ is
(a)
112
(b) 512
(c) 400
(d) 614
3. Milk turns sour at $40^{\circ} \mathrm{C}$ three times as faster as at $0^{\circ} \mathrm{C}$. Hence $\mathrm{E}_{\mathrm{a}}$ in cal (activation energy) of turning of milk sour is :
(a) $\frac{2.303 \times 2 \times 313 \times 273}{40} \log 3$
(b) $\frac{2.303 \times 2 \times 313 \times 273}{40} \log \left(\frac{1}{3}\right)$
(c) $\frac{2.303 \times 2 \times 40}{273 \times 313} \log 3$
(d) $\frac{2.303 \times 2 \times 40}{273 \times 313} \log \left(\frac{1}{3}\right)$
4. In presence of catalyst $\mathrm{E}_{\mathrm{a}}$ is lowered by 2 kcal at $27^{\circ} \mathrm{C}$. Hence rate will be :
(a)
20 times
(b)
(c)
28 times
(d) 2 times
5. Graph between $\log k$ and $\frac{1}{T}\left[k\right.$ is rate constant $\left(s^{-1}\right)$ and $T$ the temperature $\left.(K)\right]$ is a straight line with $O X=5, \theta=\tan ^{-1}\left(-\frac{1}{2.303}\right)$. Hence $E_{a}$ will be :

(a)
$2.303 \times 2$ cal
(b) $\frac{2}{2.303}$ cal
(c) 2 cal
(d) none
6. The rate constant, the activation energy and the Arrhenius parameter of a chemical reaction at $25^{\circ} \mathrm{C}$ are $3.0 \times 10^{-4} \mathrm{~s}^{-1}, 104.4 \mathrm{~kJ} \mathrm{~mol}^{-1}$ and $6.0 \times 10^{14} \mathrm{~s}^{-1}$ respectively. The value of the rate constant as T $\rightarrow \infty$ is
(a) $\quad 2.0 \times 10^{18} \mathrm{~s}^{-1}$
(b) $\quad 6.0 \times 10^{14} \mathrm{~s}^{-1}$
(c) Infinity
(d) $3.6 \times 10^{30} \mathrm{~s}^{-1}$
7. For a first order reaction, when $\log k$ was plotted against $1 / T$, a straight line with a slope of -6000 was obtained. The activation energy for the reaction is
(a)
$13.8 \times 10^{3} \mathrm{R}$
(b) 27600 cal
(c) $\quad 114.732 \times \mathbf{1 0}^{\mathbf{3}}$
(d) $1.14 \times 10^{7}$
8. The rate constant for the first order decomposition of a certain reaction is given by the equation
$\ln \mathrm{k}\left(\mathrm{sec}^{-1}\right)=14.34-\frac{1.25 \times 10^{4}}{\mathrm{~T}}$. The energy of activation in cal./mol is
(a)
$2.5 \times 10^{2}$
(b) 250
(c) $\quad 2.5 \times 10^{3}$
(d) $\quad 2.5 \times 10^{4}$
[Answers : (1) c (2) b (3) a (4) c (5) c (6) b (7) a (8) d]

## NUCLEAR CHEMISTRY

C1A Nuclear Chemistry involves the study of the nuclear changes i.e., the conversion of one element into the another element. It was observed by various scientists that the atomic nucleus of certain element undergo spontaneous disintegration into smaller fragments emitting powerful radiations. This phenomenon was defined as "Radioactivity" and is always independent of the external conditions such as temperature, pressure etc.
C1B Active Radiation emitted during the spontaneous disintegration of certain nuclei are:

| $\alpha$ particles : | $\quad{ }_{92}^{238} \mathrm{U} \longrightarrow{ }_{90}^{234} \mathbf{T h}$ | + | ${ }_{2}^{4} \mathbf{H e}$ |
| :--- | :--- | :--- | :--- |
| $\beta$ particles : | ${ }_{90}^{234} \mathbf{T h} \longrightarrow{ }_{91}^{234} \mathbf{P a}$ | + | $-\mathbf{1}^{\mathrm{e}^{0}(\beta)}$ |
| $\gamma$ rays : | ${ }_{90}^{230} \mathbf{T h} * \longrightarrow{ }_{90}^{230} \mathbf{T h}$ | $+\quad \gamma$ |  |

## Types of Radioactive Decay

| Types of Decay | Radiation | Process |  | nge | Nuclear |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | At. No. | Mass No. | Condition |
| Alpha emission ( $\alpha$ ) | ${ }_{2}^{4} \mathrm{He}$ | - | -2 |  | Z > 83 |
| Beta emission ( $\beta$ ) | $-{ }_{1}^{0} \mathrm{e}$ |  |  | 0 | $\frac{\mathbf{N}}{\mathbf{Z}}$ too large |
| Positron emission ( $\beta^{+}$) | ${ }_{1}^{0} \mathrm{e}$ |  |  | 0 | $\frac{\mathbf{N}}{\mathbf{Z}} \text { too small }$ |
| Electron capture (Ec) | X rays |  | -1 | 0 | $\frac{\mathbf{N}}{\mathbf{Z}} \text { too small }$ |
| Gamma emission ( $\gamma$ ) |  |  | 0 | 0 | Excited nucleus |

## C1C Group displacement law :

Emission of an $\alpha$-particle (a helium nucleus) lowers the atomic number by two and mass number by four; emission of a $\beta^{-}$-particle (an electron of nuclear origin) raises the atomic number by one and leaves the mass number unchanged. Thus, the new element may be displaced either to the left (two places in case of $\alpha$-emission) or to the right (one place in case of $\beta^{-}$emission) in the periodic table. This displacement is known as Group Displacement Law.

## C2A Process of Radioactive Disintegration :

The atoms of radioactive element are inharently unstable, thus they undergo spontaneous disintegration and emitting $\alpha$ or $\beta$ particles and resulting in the formation of new element which is physically and chemically different from its parent element.

* Radioactive decay follows first order kinetics.

## C2B Rate of radioactive disintegration :

The rate of distingration of a radioactive material the decay rate is directly proportional to the number of atoms present.

$$
-\frac{\mathbf{d N}}{\mathbf{d t}} \propto \mathbf{N},-\frac{\mathbf{d N}}{\mathbf{d t}}=\lambda \mathbf{N}
$$

where $-\frac{\mathbf{d N}}{\mathbf{d t}}$ represents rate of decay in disintegration of atoms per unit time (say second), $N$ the number of atoms disintegrating at that time and $\lambda$ the disintegration constant (also called decay constant).
If $N_{0}$ is the number of atoms at the start of decay and $N$ the number of atoms at a given time then by first order kinetics.

$$
\mathrm{N}=\mathbf{N}_{\mathbf{0}} \mathrm{e}^{-\lambda \mathrm{t}}, \lambda=\frac{2.303}{\mathrm{t}} \log _{10}\left(\frac{\mathbf{N}_{\mathbf{0}}}{\mathrm{N}}\right), \quad \mathrm{At} \mathrm{t}=\mathrm{T}_{50} \quad \lambda=\frac{\mathbf{0 . 6 9 3}}{\mathrm{T}_{50}} .
$$

Thus half-life period is independent of number of atoms present at a given time then $\mathbf{N}=\mathbf{N}_{\mathbf{0}}\left(\frac{\mathbf{1}}{\mathbf{2}}\right)^{\mathbf{n}}$
and in activity terms $\mathbf{A}_{\mathbf{t}}=\mathbf{A}_{\mathbf{0}}\left(\frac{\mathbf{1}}{\mathbf{2}}\right)^{\mathbf{n}}$

The average life period is related to $T_{50}$ and disintegration constant as : $\mathrm{t}_{\mathrm{av}}=\frac{\mathbf{1}}{\lambda}=\frac{\mathbf{T}_{\mathbf{5 0}}}{\mathbf{0 . 6 9 3}}$

## Practice Problems:

1. The half-life of a radioactive element is $\mathbf{1 6 0}$ days. After 800 day $\mathbf{1 g}$ of the element will reduce to
(a) $\frac{1}{10} \mathrm{~g}$
(b) $\frac{1}{20} \mathrm{~g}$
(c) $\quad \frac{1}{8} \mathrm{~g}$
(d) $\frac{1}{32} \mathrm{~g}$
2. Tritium ${ }_{1}^{3} \mathrm{H}$ has a half-life of $\mathbf{1 2 . 2 6}$ years. A 5.00 mL sample of tritiated water has an activity of $\mathbf{2 . 4 0} \times \mathbf{1 0}^{9} \mathbf{~ c p m}$. How many years will it take for the activity to fall to $3.00 \times \mathbf{1 0}^{\mathbf{8}} \mathbf{~ c p m}$. ?
(a)
6.13
(b)
12.26
(c)
24.52
(d) 36.78
3. Two substances $A$ and $B$ are present such that $[A]=4[B]$ and the half life of $A$ is 5 min . and that of $B$ is $\mathbf{1 5}$ minutes. If they start decaying at the same instant (first order), then how much time later will the concentration of both of them would be equal ?
(a)
15 minutes
(b)
10 minutes
(c) 5 minutes
(d) 12 minutes
4. Two I-order reactions have half-lives in the ratio $3: 2$. Calculate the ratio of time intervals $t_{1}: t_{2} ; t_{1}$ is the time period for $\mathbf{2 5 \%}$ completion of the first reaction and $t_{2}$ for $\mathbf{7 5 \%}$ completion of the second reaction.
(a)
0.311 : 1
(b)
$0.420: 1$
(c) $0.273: 1$
(d) $0.119: 1$
[Answers: (1) d (2) d (3) a (4) a]

## C3 Radio Carbon Dating :

The application of the $\mathrm{C}-14$ dating is based on the fundamental assumption that the intensity of cosmic ray and hence of ${ }^{14} \mathrm{C}$ in the atmosphere has been remaining constant over many thousands of years. This gives the initial activity of C-14 corresponding to the time when the plant or animal died and assimilation of radioactive carbon ceased to continue.

$$
\begin{aligned}
& { }_{7}^{14} \mathrm{~N}+{ }_{0}^{1} \mathrm{n} \longrightarrow{ }_{6}^{14} \mathrm{C}+{ }_{1}^{1} \mathrm{H} \\
& { }_{6}^{14} \mathrm{C} \longrightarrow{ }_{7}^{14} \mathrm{~N}+{ }_{-1}^{0} \mathrm{e} \\
& \text { Age }=\frac{2.303}{\lambda} \log \frac{\text { original activity }\left(\mathrm{N}_{0}\right)}{\text { final activity }(\mathrm{N})}
\end{aligned}
$$

$$
\mathrm{N}=\mathrm{N}_{\mathbf{0}}\left(\frac{\mathbf{1}}{\mathbf{2}}\right)^{\mathrm{n}} \quad \text { where } \quad \mathrm{n}=\frac{\mathrm{t}}{\mathrm{~T}_{\mathbf{5 0}}}
$$

## Practice Problems:

1. Weight of ${ }^{14} \mathrm{C}$ to have radioactivity 1 curie $\left[\lambda\right.$ (disintegration constant) $\left.=4.4 \times 10^{-12} \mathrm{sec}^{-1}\right]$ is :
(a) $2 \times 10^{-4} \mathrm{~kg}$
(b)
$0.9 \times 10^{-4} \mathrm{~kg}$
(c)
$1.7 \times 10^{-4} \mathbf{~ k g}$
(d) $3.7 \times 10^{-10} \mathrm{~kg}$
2. An old wooden chair shows a ${ }_{6} \mathrm{C}^{14}$ activity which is $80 \%$ of the activity found today. The age of the sample is. ( $\mathrm{t}_{1 / 2}$ of ${ }_{6} \mathrm{C}^{14}=5770$ years).
(a)
$1.85 \times 10^{3}$
(b)
$5.22 \times 10^{3}$
(c) $\quad 6.23 \times 10^{3}$
(d) $7.55 \times 10^{3}$
[Answers : (1) a (2) a]

C4 Rock Dating :
It is based on the kinetic of radioactive decay. It is assumed that no lead was initially present is the sample and the whole of it came from the uranium.
Initial radioactivity $=[\mathrm{U}]+[\mathrm{Pb}]=\mathrm{N}_{0}$ in terms of gram atoms
Final radioactive $=[\mathrm{U}]=\mathrm{N}$
We have assumed that due to high value of $\mathrm{T}_{50}$ of Uranium, its amount remains unchanged.

$$
\begin{gathered}
\frac{\mathrm{N}_{0}}{\mathrm{~N}}=\frac{[\mathrm{U}]+[\mathrm{Pb}]}{[\mathrm{U}]}=1+\frac{[\mathrm{Pb}]}{[\mathrm{U}]} \\
\text { Thus } \quad \mathrm{t}=\frac{2.303}{\mathrm{~T}_{50}} \log \left(\frac{\mathrm{~N}_{0}}{\mathrm{~N}}\right)=\frac{2.303}{\mathrm{~T}_{50}} \log \left[1+\frac{[\mathrm{Pb}]}{[\mathrm{U}]}\right]
\end{gathered}
$$

## Practice Problems :

1. "Landing on the moon" was the giant leap for the manking of the 'twentieth' century. Rock from there had equal number of atoms of ${ }_{92}^{238} \mathrm{U}$ and ${ }_{82}^{206} \mathrm{~Pb}$. If half life of ${ }_{92}^{238} \mathrm{U}$ is $\mathbf{4 . 5} \times \mathbf{1 0}^{9}$ years, moon is.. years old :
(a)
$9.0 \times 10^{9}$
(b)
$4.5 \times 10^{9}$
(c)
$2.25 \times 10^{9}$
(d) none
[Answers : (1) b]
