# **WORK, ENERGY, POWER AND CURVELINEAR MOTION**

### **C1A Work**

When a force acts on a body of particle that moves, the force can do work on the body. Mathematically, the

work  $W_{ba}$  done by a force F on the particle as the particle moves from a to b is defined as  $W_{ba} = \int \vec{F} \cdot d\vec{r}$ **b** .

Hence the work done by a force is defined as the dot product of the force and the distanplacement of the point of application of force. The work done by a force can be positive, negative or zero. Work depends on frame of reference.

## **C1B Graphical Interpretation Of Work Done**

Graphically, the work done by a variable force  $F(x)$  from an initial position  $x_i$  to final position  $x_f$  is interpreted as the area under the force-displacement curve, shown in figure

# **C1C Work : For Motion Along Straight Line**

### **Case I** Constant Force

Consider a body that moves along the x-axis under a constant force  $\overline{F}$  then work W done by the force W =

 $\vec{W} = \vec{F} \cdot \vec{x}$  $=$  **F**. $\vec{x}$  = Fx cos  $\theta$ 

Consider a body that moves along the x-axis under a constant force F then work V  
\n
$$
W = \vec{F} \cdot \vec{x} = Fx \cos \theta
$$
\n
$$
\Rightarrow \qquad \text{If } \theta < \frac{\pi}{2}, \text{ W is positive}
$$
\n
$$
\Rightarrow \qquad \text{If } \theta = \frac{\pi}{2}, \text{ W = 0}
$$
\n
$$
\xrightarrow{\text{F} \text{A}} \qquad \xrightarrow{\text{F} \text{B}}
$$
\n
$$
\Rightarrow \qquad \text{If } \theta > \frac{\pi}{2}, \text{ W is negative}
$$
\n
$$
\xrightarrow{\text{F} \text{C}} \qquad \xrightarrow{\text{F} \text{C}}
$$
\n
$$
\xrightarrow{\text
$$

$$
\rightarrow \qquad \text{If } \theta = \frac{\pi}{2}, \text{ } W = 0 \quad \xrightarrow{\text{F} \text{A}} \quad \xrightarrow{\text{A} \text{F}}
$$

$$
\rightarrow \qquad \text{If } \theta > \frac{\pi}{2}, \text{ W is negative} \qquad \qquad \underbrace{\text{F} \times \text{F} \times \text{
$$

 $\rightarrow$  If force is in direction of displacement i.e.  $\theta = 0$ ,  $W = Fx$ 

 $\rightarrow$  If force is in opposite to displacement i.e.  $\theta = \pi$ ,  $W = -Fx$ 

# **Work Done By Several Constant Forces**

Choose the initial and final positions of the body, and draw a free body diagram showing all the forces that act on the body. List the forces and calculate the work done by each force. Add the amounts of work done by the separate forces to find the total work done.

# **Case II Work Done by Variable Force**

Consider a body moves along the x-axis from position  $x_1$  to  $x_2$  under a variable force F. Then work done by

this force is 
$$
\mathbf{W} = \int_{x_1}^{x_2} \vec{F} \cdot d\vec{x}
$$
.

#### **Work done by Spring Force**

The spring force is a variable force and work done by spring force to extend or compress the spring from  $x_1$ 

and  $x_2$  is given by  $W = -\frac{1}{2}k(x_2^2 - x_1^2)$ . It does not mean that work done by spring force is always negative.

### **C1D Work : for Motion along Curved Path**

We can generalize our definition of work further to include a force that varies in direction as well as in magnitude and a displacement that lies along a curved path. Suppose a particle moves from point  $P_1$  to  $P_2$ along a curve, as shown in figure :

We divide the portion of the curve between these points into many infinitesimal vector displacements **dl**  $\overline{a}$ **d** . Each **dl**  $\overline{\phantom{a}}$ **d** is tangent to the path at its position. Let **F**  $\overline{\phantom{a}}$ be the force at a typical point along the path, and let  $\theta$ be the angle between **F**  $\rightarrow$ and **dl**  $\rightarrow$ **d***l* at this point.

Then  $dW = F.dl = F\cos\theta dl$  $\overline{a}$ 

$$
\Rightarrow \qquad \mathbf{W} = \int_{P_1}^{P_2} \vec{\mathbf{F}} \cdot d\vec{l}
$$

**Practice Problems :**

**1. Find the work done in the following cases :**

- **2. A man moves on a straight horizontal road with a block of mass 2 kg in his hand. If he moves a distance of 40 m with an accleration of 0.5 m/s<sup>2</sup> . Calculate work done by the man on the block during motion.**
- **3. A man weighing 55 kg supports a body of 20 kg on his head. Calculate work done by him if he moves a** distance of 20 m (i) on a horizontal road, (ii) upon incline of 1 in 5. Take  $g = 10 \text{ ms}^{-2}$ .
- **4. An elastic string of unstretched length L and force constant k is stretched by a small length x. It is further stretched by another small length y. The work done in the second stretching is**

(a) 
$$
\frac{1}{2}ky^2
$$
 (b)  $\frac{1}{2}k(x^2 + y^2)$  (c)  $\frac{1}{2}k(x + y)^2$  (d)  $\frac{1}{2}ky(2x + y)$ 

**5. A cord is used to lower vertically a block of mass M a distance d at a constant downward acceleration of g/4. Then the work done by the cord on the block is**

(a) 
$$
\frac{Mgd}{4}
$$
 (b)  $\frac{-Mgd}{4}$  (c)  $\frac{3Mgd}{4}$  (d)  $\frac{-3Mgd}{4}$ 

**6. A tracter pulls a block, of weight 14, 700 N, a distance of 20 m along the level road. The tractor exerts a constant 5000 N force at an angle of 37<sup>0</sup> above the horizontal. There is a 3500 N friction force opposing the motion. The total work done by all the forces**

**(a) 10 kJ (b) 20 kJ (c) 30 kJ (d) 40 kJ [Answers : (2) 40 J (3) Zero; 3000 J (4) d (5) d (6) a]**

### **C2 Conservative Forces**

A force is conservative force if the net work it does on a particle moving around every closed path, from an initial point and then back to that point, is zero, Equivalently, it is conservative if the net work it does on a particle moving between two points does not depend on the path taken by the particle. The gravitational force and the spring force are conservatives; the kinetic frictional force is a non-conservative force. Any dissipative force is non- conservative in nature.

### **C3 Kinetic Energy**

Kinetic energy is a scalar quantity associated with the motion of the particle. Mathematically kinetic energy

of a body or particle of mass m having speed v is given by  $\frac{1}{2}mv^2$  $\frac{1}{6}$ **mv**<sup>2</sup>. Kinetic energy depends on frame of

reference.

## **C4 Work Energy Theorem**

Work is associated with kinetic energy. In any displacement of a particle, the change in its kinetic energy equals the total work done by all the forces acting on the particle.

$$
\mathbf{W} = \mathbf{K}_{\mathbf{f}} - \mathbf{K}_{\mathbf{i}} = \Delta \mathbf{K}
$$

This result is the work - energy theorem.

- $\rightarrow$  Work energy theorem is valid even when force varies during the displacement and for all types of motions.
- $\rightarrow$  Work energy theorem is valid for all types of force acting on the body i.e. for conservative and non-conservative forces.

#### **Practice Problems :**

**Frameworth** Summary In any displacement of a particle, the chat<br>
the forces acting on the particle.<br> **FRAME INTERENT ACTES**<br> **1. The displacement x of a particle of mass m kg moving in one dimension, under the action of a force,** is related to the time t by the equation  $t = \sqrt{x} + 3$  where x is in metres and t is in seconds. The work **done by the force in the first six seconds in joules is**

**(a) 0 (b) 3 m (c) 6 m (d) 9 m**

$$
(\mathbf{c})
$$

**2. A particle of mass 0.1 kg (moving along x-axis) is subjected to a force, which varies with distance (x)** as shown in figure. It starts journey from rest at  $x = 0$ , its speed at  $x = 12$  m is

## **C5 Potential Energy**

Potential energy is energy associated with the position of a system rather than its motion. Potential energy function is defined only for conservative forces. The work done on a body by conservative forces can be expressed as a change in potential energy i.e.  $dW_c = -dU$ .

#### **Gravitational Potential Energy**

Work done by gravitational force during the vertical motion of a body from an initial position  $y_1$  to final

$$
position y_2 \text{ is given } \mathbf{W}_c = -\mathbf{mg} \int_{y_1}^{y_2} \mathbf{dy} = -\mathbf{mg}(\mathbf{y}_2 - \mathbf{y}_1)
$$

As  $dW_c = -dU \Rightarrow U_f$  $-U_i = mgy_2 - mgy_1$ .

Above expression shows that we can express work done by gravitational force in terms of the values of the quantity mgy at the beginning and end of the displacement. This quantity, the product of the weight mg and the position y above the reference level, is called the gravitational potential energy i.e.  $U = mgy$ .

**x**<br> **W** and  $\mathbf{W}_z = -d\mathbf{U} \Rightarrow \mathbf{U}_z - \mathbf{U}_z = \mathbf{w}$ <br>
Above expression shows that we can express work done by gravitational forces in equal<br>
departing an debt beginning and of of the displacement. This quantity, the<br>
p Remember that to define the gravitational potential energy we need a reference level. Above the reference level the gravitational potential energy is positive, on the reference level the gravitational potential energy is zero whereas below the reference level the gravitational potential energy is taken as negative.

### **Spring Potential Energy**

Free level the gravitational potential energy is talcompressed) work is done against the spring force<br>potential energy.<br>Pression a spring from  $x_1$  to  $x_2$  is given by  $-\frac{1}{2}k$ <br>al energy =  $\frac{1}{2}k(x_2^2 - x_1^2)$ .<br>a sp When a spring is elongated (or compressed) work is done against the spring force. This work done is stored in the spring as spring or elastic potential energy.

Work done in stretching or compression a spring from  $x_1$  to  $x_2$  is given by  $-\frac{1}{2}k(x_2^2 - x_1^2)$  $-\frac{1}{2}k(x_2^2 - x_1^2)$ 

Hence, change in spring potential energy =  $\frac{1}{2}$ **k**( $\mathbf{x}_2^2 - \mathbf{x}_1^2$ )  $\frac{1}{2}$ **k**(**x**<sub>2</sub><sup>2</sup> - **x**<sub>1</sub><sup>2</sup>).

The spring potential energy for a spring extended by amount 'x' or compressed by amount 'x' is  $\frac{1}{2}kx^2$ .

# **C6 Conservative Force And Potential Energy Function**

A conservative force can be derived from a scalar potential energy function. The slope of the potential energy function is a measure of the magnitude of conservative force.

In one dimension, it is defined as the negative derivative of potential energy with respect to distance i.e.,

$$
\mathbf{F}_{\mathbf{c}} = -\frac{\mathbf{d}\mathbf{U}}{\mathbf{d}\mathbf{x}}
$$

The figure shows a graph of potential energy function  $U(x)$  for one dimensional motion. Three specific points A, B and C are chosen.

At point A, a very strong force is acting because the slope is very large.

At B and C, no force acts as the slope is zero, these two are the equilibrium positions. At equilibrium,

 $\frac{dS}{dx} = 0$  $\frac{dU}{dt} = 0$ .

The point B is the position of stable equilibrium, as U is minimum and  $\frac{d^2v}{dx^2} > 0$  $d^2U$ **2 2**  $\mathbf{I}$ 

The point C is the position of unstable equilibrium, as U is maximum and  $\frac{dC}{dx^2} < 0$  $\mathbf{d}^2 \mathbf{U}$ **2 2**  $\prec$ 

#### **C7 Mechanical Energy**

The mechanical energy  $E_{\text{mec}}$  of a system is the sum of its kinetic K and its potential energy U :

$$
E_{\text{mec}} = K + U
$$

As isolated system is one in which no external force causes energy changes. If only conservatives force do work within an isolated system, then the mechanical energy  $E_{\text{mec}}$  of the system cannot change. This **principle of conservation of mechanical energy** is written as

$$
\mathbf{K}_2 + \mathbf{U}_2 = \mathbf{K}_1 + \mathbf{U}_1,
$$

in which the subscripts refer to different instants during an energy transfer process. This conservation principle can also be written as

$$
\Delta E_{\text{mec}} = \Delta K + \Delta U = 0
$$

#### **Practice Problems :**

# **C9A Curvelinear Motion**

(Frower)<sub>*x*cma</sub> =  $\frac{dW}{dt}$  and (Frower)<sub>*x*</sub> =  $\frac{dW}{dt}$ <br>
From P =  $\frac{dW}{dt}$ , we can write P =  $\bar{F}$ ,  $\bar{v}$ <br> **Precise Problems:**<br> **Precise Problems**<br> **Precise Problems**<br> **Precise Problems**<br> **Precise The harman he** The velocity of a particle traversing curved path, can change both in mgnitude as well as in direction. Remember that the velocity vectos is always tangential to the path. The force which is responsible to change the magnitude of velocity vector i.e. speed is known as tangential force  $(F_{\rho})$  where the force which is responsible to change the direction of velocity vector is known as centripetal force  $(F_c)$ . Centripetal force is also known as normal force or radial force. Tangential force acts along the tangent whereas the centripetal force directed towards the centre as shown in figure.

According to Newton's second law,

the net force along the tangent  $\sum \mathbf{F_t} = \mathbf{ma_t} = \mathbf{m} \frac{d\mathbf{v}}{dt}$ 

the net force along the normal  $\sum \mathbf{F}_c = \mathbf{ma}_c = \frac{\mathbf{mv}^2}{\mathbf{R}}$  $_{\rm c}$  =  $_{\rm m}$  $_{\rm c}$ 

Here ttangential acceleration

a<sub>c</sub>: centripetal acceleration

V : speed of the particle

R : radius of curvature of the path

Hence the net force acting on the particle

$$
\mathbf{F} = \sqrt{\mathbf{F}_t^2 + \mathbf{F}_c^2} = \mathbf{m}\sqrt{\mathbf{a}_t^2 + \mathbf{a}_c^2} = \mathbf{m}\mathbf{a} \text{ where } \mathbf{a} = \sqrt{\mathbf{a}_t^2 + \mathbf{a}_c^2} \text{ is the net acceleration. Circular}
$$

motion and projectile motion are the examples of curvelinear motion.

#### **C9B Uniform Circular Motion**

When a particle moves in a circle with constant speed, the motion is called uniform circular motion. There is no tangential acceleration i.e.,

$$
a_t = \frac{dv}{dt} = 0 \text{ but } a_c = \frac{v^2}{R}
$$

**F** =  $\sqrt{F_t^2 + F_c^2}$  and  $\sqrt{a_t^2 + a_c^2}$  ann where  $a = \sqrt{a_t^2 + a_c^2}$  is the net acceleration. Circular motion and projectile motion are the examples of curvelinear motion.<br> **B** Uniform Circular Motion<br> **When a particle w** In uniform circular motion the acceleration is perpendicular to the velocity at each instant; as the direction of the velocity changes, the direction of this acceleration also changes. The centripetal acceleration  $(a_0)$  at each point in the circular path is directed toward the centre of the circle. We can also express the magnitude of the acceleration in uniform circular motion in terms of the period  $T$  of the motion, the time for one revolution

$$
T = \frac{2\pi R}{v} \implies a_c = \frac{4\pi^2 R}{T^2}
$$

If the speed varies, we call the motion is non-uniform circular motion. In this case

$$
a_t = \frac{dv}{dt} \neq 0
$$
 and  $a_c = \frac{v^2}{R}$ 

Free the contract of the circle. We can also<br>
From the centre of the period T of the n<br>
From the period T of the n<br>
From the period T of the n<br>
From the period T of the n<br>
Motion is non-uniform circular motion. In this ca Cetrifugal force is a pseudo force, which is experienced by a non-inertial observer moving in a circular path with constant speed. Its magnitude is equal to that of the centripetal force but its direction is exactly opposite to that.

**Practice Problems :**
